Subsystem: Fatty Acid Biosynthesis FASII

Andrei Osterman^{1,2} ¹The Burnham Institute, ²FIG

Introduction

Fatty acid biosynthesis is one of the most conserved components of bacterial biosynthetic machinery, (for reviews see [1.2]). With a few exceptions (such as in Mycoplasmas) Fatty Acid Synthase (FAS) multienzyme complex is present in all bacteria and eukaryotes, but it is absent in archaea. Saturated and unsaturated fatty acids participate in a number of cellular processes, most importantly in building the cell envelope. Most of the FAS-related genes are indispensable for cell growth and survival, as demonstrated in a number of gene essentiality studies in model (*E.coli, B.subtilis*) and pathogenic (*H.influenzae, S.aureus, S.pneumoniase*) bacteria.

Eukaryotic and bacterial FAS drive fundamentally the same sequence of biochemical transformations, although structurally they are highly divergent. In eukarytotic (non-dissociable) FAS I, most of the catalytic domains are encoded in one gigantic modular polypeptide chain, In a typical bacterial (dissociable) FAS II, individual components (enzymes and carrier proteins) are encoded by separate genes. Most (but not all) of these components are clearly homologous to functional domains of eukaryotic FAS I.

FASII is a complex system with significant variations and peculiarities, which are relatively poorly understood beyond a handful of model organisms. In this example we will limit a discussion of FASII by a group bacterial pathogens, which are in focus of the NMPDR project (see <u>www.nmpdr.org</u>). We will illustrate possible applications of a subsystems approach for the analysis of a possible phenotype, including susceptibility to a particular type of antibiotics. Expansion of this subsystem over a wide variety of bacterial species is a project in development, and we will continue updating this subsystem on a publicly available SEED web-site.

Subsystem Notes (focusing on NMPDR bacterial pathogens)

- One of the important variations in this subsystem (see Panel 1) is the existence of alternative (nonorthologous) forms of Enoyl-ACPreductase. A classic NAD dependent form (FabI, as in E.coli), which is present in most bacterial species, is a proven target for popular antibiotics, such as triclosan. Recently, it was shown that enoyl-ACP-reductase in *S. pneumoniae* (lacking a classic *fabI*), is encoded by a nonhomologous gene *fabK* [3,4]. FabK is very distantly related to the FMN-dependent enoyl-ACP-reductase domain of eukaryotic FASI, and it is completely insensitive to the inhibitors of bacterial FabI, providing a rational for the known triclosan-resistance of *S. pneumoniae* and other bacteria with the same gene pattern.
- The analysis of functional variants (ocurrence of FabK/FabI) over a subset of bacterial pathogens provides a possibility to tentatively rationalize and even predict the triclosan sensistivity/resistance (see Panel 2,3,4). However, *Vibrio* ssp represent a case of an open problem. None of them have strong candidates for FabI, although they contain several paralogs with relatively low scores. Most of the species in this group (except Vibrio parahaemolyticus) also lack strong FabK candidates. Additional studies are required to elucidate this aspect of FAS in Vibrio ssp.
- Another type of conjectures can be made by considering the presence of one of the two described branching pathways of Unsaturated Fatty Acids (UFA) biosynthesis (see Panel 2,3,4). *Vibrio* ssp seem to be capable of producing UFAs using the same two-step fabB/fabA branching pathway as in *E.coli*. An alternative UFA branching pathway involving a universally conserved *fabF* gene and a relatively rare *fabM* gene was described in *S.pneumoniae* [5], which does not have *fabA/fabB* homologs. This alternative UFA pathway is relatively rare, and it is apparently not present in *Staphylococci, Listeria* and *Campylobacter* ssp. Genetics and enzymology of UFA synthesis in these organisms remain to be explored.
- Finally, the analysis of a chromosomal cluster in *S.pneumoniae* and a number of related species (see illustration) reveals the presence of an uncharacterized transcriptional regulator of MarR family (see Paneel 5). It is tempting to speculate that this protein may be involved in the regulation of FAS operon in these species.

Variant codes:

Basic variants:

#1 as in *E.coli*, including FabI and UFAI (FabA/FabB)

#2 as inS.p.neumoniae, including FabK and FabM-driven UFAII

Subvariants and hybrid (examples):

#10: Variant #1 with 1 missing gene (as in V cholerae)

#11: Variant # 1 w/o UFA (as in *Campylobacter*)

#12: Hybrid of #1 and #2 (as in V.parahaemolyticus): FabI with UFAI

#112: Hybrid of #11 and #2: with both FabI and FabK

Column	Abbrev	Functional Role						
1	BCCP	Biotin carboxyl carrier protein of acetyl-CoA carboxylase						
2	BC	Biotin carboxylase of acetyl-CoA carboxylase (EC 6.3.4.14)						
3	AccA	Acetyl-coenzyme A carboxyl transferase alpha chain (EC 6.4.1.2)						
4	AccD	Acetyl-coenzyme A carboxyl transferase beta chain (EC 6.4.1.2)						
5	ACP	Acyl carrier protein						
6	ACPS	Holo-[acyl-carrier protein] synthase (EC 2.7.8.7)						
7	PPT	4'-phosphopantetheinyl transferase (EC 2.7.8)						
8	FabD	Malonyl CoA-acyl carrier protein transacylase (EC 2.3.1.39)						
9	FabF	3-oxoacyl-[acyl-carrier-protein] synthase, KASII (EC 2.3.1.41)						
10	FabH	3-oxoacyl-[acyl-carrier-protein] synthase, KASIII (EC 2.3.1.41)						
11	FabG	3-oxoacyl-[acyl-carrier protein] reductase (EC 1.1.1.100)						
12	FabZ	(3R)-hydroxymyristoyl-[acyl carrier protein] dehydratase (EC 4.2.1)						
13	Fabl	Enoyl-[acyl-carrier-protein] reductase [NADH] (EC 1.3.1.9)						
14	FabK	Enoyl-[acyl-carrier-protein] reductase [FMN] (EC 1.3.1.9)						
15	FabL	Enoyl-[acyl-carrier-protein] reductase [NADPH] (EC 1.3.1.10)						
16	FabB	3-oxoacyl-[acyl-carrier-protein] synthase, KASI (EC 2.3.1.41)						
17	FabA	3-hydroxydecanoyl-[acyl-carrier-protein] dehydratase (EC 4.2.1.60)						
18	FabM	Trans-2,cis-3-Decenoyl-ACP isomerase

Matching colors highlight genes that occur close to each other on the chromosome. Genes (proteins) assigned with respective functional roles are shown by unique FIG IDs. Alternative forms are indicated by additional numbers, dash-separated."Missing genes" are indicated by "?". Susceptibility to triclosan inferred from the FabI/FabK occurrence is marked as "R" (resistant) and "S" (sensitive). Presence of UFA pathways inferred from the occurrence of FabA/FabB vs FabF/FabM is shown by "I" and "II", respectively. Some of the examples are further illustrated by projection on a subsystem diagram.

3. Example: C. jejuni (variant #11)

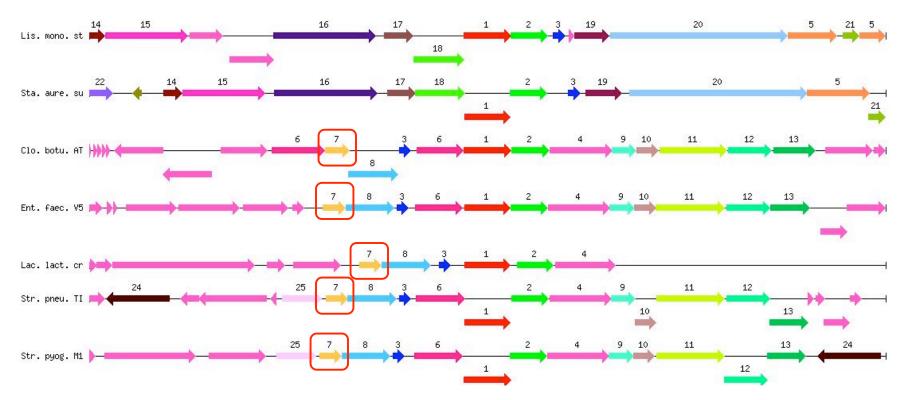

4. Example: S. pneumoniae (variant #2)

5. A conserved chromosomal cluster in S. pneumoniae and related species

allows to propose a candidate for FAS transcriptional regulator_

	Set	Protein in S.pneumoniae	Annotation
